BUGS FIXED

POS Dashboard — Full Rewrite + 4 Bug Fixes

PR #1024 · MERGED · 5 commits

The POS Dashboard was completely rewritten. The old design toggled between a "Dashboard" view and a "Sales History" view using buttons — confusing and the source of multiple JS bugs. The new design shows Sales History always at the top and the Dashboard always below, no toggle needed. A proper period filter was added with smart date pickers specific to each period type.

FEAT

POS Dashboard Rewrite — Sales History First, Period Filter, Toolbar

Sales History section always visible at top of page — no longer hidden behind a toggle.

Dashboard section always visible below it — toggle buttons removed entirely.

Period filter with 5 modes and smart date pickers per mode:

- Daily → single date (defaults to today)
- Weekly → pick any date; Mon–Sun range computed automatically and labelled
- Monthly → month + year dropdowns (default: current month)
- Quarterly → Q1–Q4 + year dropdowns
- Yearly → year dropdown (default: current year, last 5 years listed)

Default period changed from Monthly to Yearly.

Copy / CSV / Print toolbar added above the sales table, matching suppliers.php style.

Error handling: `loadDashboard()` now has a `.fail()` handler — previously the page could show "Loading..." forever if the API failed.

ui-constants.md compliance: stat cards, modal headers, gear dropdown all follow the standard.

File: `app/bms/pos/pos_dashboard.php` Test: 74 checks, all passing.

FIX 1

safeOutput Undefined + Period Filter Panel Fix

Bug: `safeOutput()` was called in JS but is not a global in this codebase — caused DataTable and dashboard widget JS errors on every page load.

Fix: Defined `safeOutput()` locally in `pos_dashboard.php`.

Also: `getDateRange()` and `showFilterPanel()` replaced the old `setPeriodDates()` which did not handle the new period-specific pickers. All Apply buttons unified via `.apply-btn` class delegation.

Tests: 88 checks, all passing.

FIX 2**Stat Cards Not Updating When Period Changed**

Bug: `getActivePeriod()` read `.active` CSS class but the click handler only swapped `btn-primary` ↔ `btn-outline-primary` — `.active` was never set. So stat cards always used the initial Yearly range regardless of which period button was clicked.

Fix: Changed `getActivePeriod()` to read `.btn-primary` class instead of `.active`.

Also: Recent Sales and Low Stock converted to proper DataTables (S/NO column, pagination, sort).

`initDashboardTables()` initialises once; `loadDashboard()` uses `.clear().rows.add().draw()` to refresh data without destroying and recreating the table.

Tests: 95 checks, all passing.

FIX 3**BMS Print Footer Missing in DataTables Print Window**

Bug: DataTables Print opens a new browser window containing only the table — `footer.php`'s `.bms-print-footer` div is never cloned there. Printed POS reports had no footer (no company name, no user name, no date).

Fix: Added a DataTables `customize` callback that appends the full BMS footer structure (user name, role, datetime, BJP Technologies copyright) with inline styles matching the `@media print` rules.

Also added `PRINT_ROLE` and `PRINT_YEAR` JS constants; corrected `PRINT_USER` to read from session at page-render time (it previously referenced `$_print_username` which is set in `footer.php`, after the JS block).

Tests: 98 checks, all passing (3 new checks).

FIX 4**Period Button Shows Double-Selection + Redundant Dashboard Reload**

Bug 1: The "Yearly" period button had a hardcoded Bootstrap `active` class. The click handler never removed it, so after selecting any other period, both that period AND Yearly appeared selected (both filled blue) simultaneously.

Fix: Removed hardcoded `active` class from Yearly button — `btn-primary` alone provides the visual selection state.

Bug 2: `voidSale()` and `openReturn()` called `loadDashboard()` unconditionally on success, firing an extra AJAX request even when the Dashboard panel was hidden.

Fix: Guarded with `if (!$('#paneDashboard').hasClass('d-none'))`.

Tests: 98 checks, all passing.

Project View, Projects & Budget — 4 Fixes

6 commits · 2 files

Project Edit — Contract Sum Shows Milestone Total Instead of Stored Value

FIX

- ▶ **Bug:** The Edit Project modal pre-filled the "Contract Sum" field with the milestone-calculated total, not the stored value. `get_project.php` overwrites `contract_sum` with the milestone sum before returning data; the JS was reading that overwritten field.
- ▶ **Fix:** Switched the modal to read `form_contract_sum` which carries the raw stored database value.
- ▶ File: `app/bms/operations/projects.php`

Project View Print — Footer Says "Document" Instead of "Report" on Performance Tab

FIX

- ▶ **Bug:** The footer.php always *"This document was printed..."* but when printing the Project Performance Report tab, it should say *"This report was printed..."*
- ▶ **Fix** beforeprint event `#performance tab .show / .active — nodeType===3 text-node <str` (final): checks has only walk if the then (preserving swaps the text using a
- ▶ All other tabs (Overview, Budget, Expenses, Invoices, Procurements) correctly retain "document".
- ▶ PDF exports already handled in their own jsPDF functions — not affected.
- ▶ **Also fixed:** Removed an erroneous A3 @page margin override. Replaced with standard BMS print margins (10mm top / 8mm right / 16mm bottom / 8mm left) landscape
- ▶ File: `app/bms/operations/project_view.php`

Budget — Non-Admin Users Blocked From Creating Budgets

CRITICAL FIX

- ▶ **Bug:** Budget `canCreate('budgets')` (plural) but the permission key is `'budget'` (singular). These are different entries in the permissions table — they never matched. Non-admin users got "Access Denied" even with full budget permissions granted. Admins were unaffected because their bypass skips the check entirely.
- ▶ **Fix:** Changed `canCreate('budget')` API to button permission gate from `canEdit` to `canCreate`.
- ▶ **Also:** Improved activity log message from raw database IDs to human-readable format: "Budget 'Q1 Operations' for Jan–Mar 2026 (TZS 5,000,000) created".

Project > Procurements — DataTable Fix Across All 12 Sub-Modules

PR #1027 · MERGED ·
project_view.php

Inside Project Details → Procurements tab there are 12 sub-tabs: Delivery Notes, Purchase Orders, Delivery Orders, Return Notes, Debit Notes, Suppliers, NIP Products, Materials, GRNs, Purchases, Purchase Full, and Invoices. All had DataTable problems — missing pagination controls, invisible tables after toggle, or no DataTable at all. All 12 verified in browser at project ID=16: table on web, card-toggle where applicable, print column widths stable, S/NO column present.

DN, Delivery Orders, Inventory — Pagination and Info Strips Missing FIX

- ▶ These three dom value '`<"top d-print- none" f>rt<"clear">`' which 1), i), and p) — leaving a table used a stripped info pagination with no page controls custom the length bar (and no row count DataTable control (shown.
- ▶ Fixed to '`<"d-print-none" lf>rtip`' — restores all controls while keeping search hidden on print.

Return Notes, Debit Notes, Suppliers, NIP — Card/Table Toggle Made Table Invisible FIX

- ▶ **Bug:** The `renderForTable()` before `.dataTables_wrapper` inside `.table-`, but DataTable toggle `DataTable` responsive had not yet called `was` wrapped the initialised. The element — so nothing was found, the table toggle handler became invisible, looked and could not be for restored.
- ▶ **Fix:** Initialise DataTable first on tab load, then wire the toggle. The wrapper now exists when the toggle needs to find it.

Materials — Converted from Custom Manual Pagination to Real DataTable FIX

- ▶ Materials was the most `procFilterMatTable()`, `procGoToMatPage()`, a custom filter bar divergent: completely custom HTML block, and a AJAX row-injection with manual custom pagination div. No DataTable at all.
- ▶ Replaced `loadProcMaterials()` now `<tbody>` then `DataTable()`. Custom filter bar, pagination div, entirely: fills calls and both custom JS functions the removed.

Remaining 8 Tabs (Purchases, GRNs, Invoices, etc.) — Destroy+Reinit Pattern FIX

- ▶ `renderReturns`, `renderProjectDebitNotes`, `renderProjectSuppliers`, `projNipRenderTable`, `renderPurchases`, `renderPurchasesFull`, `renderGRNs` — all already had an S/NO column.
- ▶ Added DataTable destroy+reinit pattern so switching tabs and back does not throw "Cannot reinitialise DataTable" errors.

Bank Reconciliation — Complete 4-Phase Upgrade

PR #1029 · MERGED · 52 files · +10,959 / -82

The bank reconciliation system had two core problems: (1) book balance was read from `accounts.current_balance` which can drift from the actual GL, and (2) petty cash transactions never appeared in the bank register. Both fixed, plus adjusting-entry workflow, period overlap guard, beginning-balance chain, two-column print report, period lock, and unreconcile with audit trail.

Phase 1

Period-Aware Book Balance + Petty Cash in Bank Register

New function `accountLedgerBalanceAsOf(PDO, $accountId, $asOf)` in `core/account_balance.php` — computes true GL balance as of any date from `journal_entry_items` (posted only), replacing the stale `accounts.current_balance`.

`create_reconciliation.php` `book_balance` now calls this function with the period-end date.

`get_bank_balance.php` rewritten to return ledger-as-of balance when `as_of` param provided.

Petty cash: `api/petty_cash/save_transaction.php` calls `recordBankTransaction()` after each post; edit path calls `reverseBankTransaction()` first; delete path clears register rows by reference number.

Migration: `migrations/2026_06_29_bank_recon_opening_balance.php` — adds `opening_balance` column to `bank_reconciliations`.

Phase 2

Adjusting Journal Entries + Create-from-Statement-Line

New table `bank_reconciliation_adjustments` (migration `2026_06_29_bank_recon_adjustments_table.php`, InnoDB, no FK to `bank_reconciliations` which is MyISAM).

New API `api/account/add_reconciliation_adjustment.php`: 6 types (bank_charge, interest_earned, NSF, standing_order, other_out, other_in). Posts balanced GL entry, writes bank register row, auto-matches, stores in adjustments table.

New API `api/account/create_entry_from_statement_line.php`: for transactions on bank statement not yet in books — creates GL entry and auto-matches the original line.

UI: "Add Adjustment" button + modal, "Create Entry" button on unmatched lines, Adjustments panel listing all adjustments with type/amount/memo.

Phase 3

Beginning-Balance Chain + Two-Column Print Report + Overlap Guard

Overlap guard: `create_reconciliation.php` rejects new reconciliations whose period overlaps an existing non-cancelled one for the same bank account.

Beginning-balance chain: `opening_balance` auto-populated from the prior finalized reconciliation's `adjusted_balance` — unbroken chain. If no prior, `opening_balance` = 0.

Worksheet exclusion: lines already cleared in a different reconciliation excluded from current worksheet.

Two-column print report: Bank Statement side (statement balance ± uncleared items = adjusted bank balance) vs Book side (book balance ± adjustments = adjusted book balance). "BALANCED" in green or "UNBALANCED" in red.

Phase 4

Period Lock + Unreconcile With Audit Trail

New core `core/recon_period_lock.php` — `assertNotInFinalizedReconPeriod(PDO, $entryId)` : checks if any account touched by a journal entry has a finalized reconciliation covering that date; throws descriptive Exception if so.

Wired into 3 journal mutation endpoints: `void_journal.php` , `reverse_journal.php` , `update_journal.php` — all block if entry date falls in a locked period.

New API `api/account/unreconcile.php` (requires `canApprove`): reverts reconciliation → pending, reverts bank_transactions → cleared, logs full audit trail with mandatory reason (≥10 chars).

UI: "Unreconcile" button (canApprove only), SweetAlert2 confirmation, reason textarea.

All Bugs Fixed Today

8 bugs

SEVERITY	BUG	ROOT CAUSE	FIX
CRITICAL	Non-admin users blocked from creating budgets	API checked <code>canCreate('budgets')</code> (plural); key is <code>'budget'</code> (singular) — never matched	Changed to <code>canCreate('budget')</code> ; fixed button gate from <code>canEdit</code> → <code>canCreate</code>
HIGH	POS stat cards always showed Yearly data regardless of selected period	<code>getActivePeriod()</code> read <code>.active</code> class; handler only toggled <code>btn-primary</code> — <code>.active</code> never set	Changed to read <code>.btn-primary</code> which the handler does toggle
HIGH	Procurement Materials tab: broken custom pagination, not a DataTable	Custom AJAX row-injection with manual pager functions — no DataTable at all	Removed custom functions; rewritten as real DataTable with <code>destroy+reinit</code>
HIGH	Return Notes / Debit Notes / Suppliers / NIP card toggle made table invisible	<code>renderForTable()</code> ran before DataTable init; toggle sought <code>.dataTables_wrapper</code> which did not exist yet	Initialise DataTable first; wire toggle after; wrapper now exists when needed

SEVERITY	BUG	ROOT CAUSE	FIX
MEDIUM	Project edit modal shows milestone total in Contract Sum field	get_project.php overwrites contract_sum before returning; JS read that overwritten value	Read form_contract_sum (raw stored value) instead
MEDIUM	POS period button: Yearly and selected period both highlighted simultaneously	Yearly button had hardcoded Bootstrap active class; click handler never removed it	Removed hardcoded active class; btn-primary alone provides selection state
MEDIUM	BMS footer absent from DataTables Print window in POS	DataTables Print opens a new window — footer.php markup is never cloned into it	Added customize callback that appends full BMS footer with inline print styles
MEDIUM	Project View prints "This document was..." even on the Performance Report tab	Shared footer.php always uses "document"; no tab-aware swap existed	beforeprint swaps to "report" only when Performance tab is active; afterprint restores

GL / Financial Report Analysis — Why IS Shows Loss While BS Is Balanced

Research & Diagnosis

Full diagnostic investigation performed today. Both Income Statement and Balance Sheet read only `journal_entries` — the report code is correct. The problem is what gets posted there.

Root Cause — Revenue Almost Completely Missing from the GL

Only ~550M TZS of revenue has ever reached a revenue-category account in `journal_entries` (7 invoice approvals + 32 POS sales). All other revenue flows through `recordGlobalTransaction()` which mirrors to the GL as `entity_type='books_transaction'` — but the credit leg lands on account 2 (*Opening Balance Equity*, inactive, equity) NOT on any revenue account.

Why Balance Sheet Looks Positive While IS Shows a Loss

The mirror posts Dr account 13 (*Marketing*, inactive, expense) / Cr account 2 (*Opening Balance Equity*, inactive, equity). IS sees 12.5B expenses with zero revenue → loss. BS sees 12.5B equity credits → looks positive. Meanwhile 552 payroll accruals correctly post 151B salary expenses → IS shows massive loss, BS shows 151B in liabilities offset by equity.

Where Old Data Is Stored

`recordGlobalTransaction()` writes to: (1) `transactions` table (header); (2) `books_transactions` table (Dr/Cr legs with OLD pre-2024 account IDs); (3) `journal_entries` mirror using those same old IDs; (4) `accounts.current_balance` via `applyAccountBalanceDelta()`. The GL mirror exists but the account classifications are wrong.

Fix Path — F1 Legacy Dual-Write Cleanup (Next Phase)

Replace `postInflow()` / `recordGlobalTransaction()` in 8 remaining flows (IN-1/2/4, OUT-5/6/9/10/11) with direct `postLedgerEntry()` calls using correct new account codes (1-1200 AR, 4-1000 Sales Revenue, etc.). Revenue will finally land in a revenue account and the IS will show the real picture.

Double-Entry Coherence — Done

- All 4 statements read one GL
- Invoice revenue (`postInvoiceRevenue`)
- POS sale + COGS (`postPosSale`)
- POS return (`postPosReturn`)
- All expense flows OUT-1..4
- Payroll, statutory OUT-7..8
- GRN, Assets, IPC OUT-12..16

Double-Entry Coherence — Remaining

- F1: 25 callsites still use `recordGlobalTransaction`
- F2: `journal_mappings` all `is_active=0` (dead)
- 12 POS sales missing COGS GL entries (backfill)
- IN-1/2/4, OUT-5/6/9/10/11 need direct posting

Next Steps

1

F1 Legacy Dual-Write Cleanup (PRIORITY — fixes the Income Statement)

Replace `postInflow()` / `recordGlobalTransaction()` in 8 remaining flows with direct `postLedgerEntry()` using correct account codes. Revenue will finally land in a revenue account.

2

Bank Reconciliation — Production Deployment

Run 2 new migrations on live server. Confirm `canApprove('bank_reconciliation')` assigned to Accountant and Manager roles in live permissions.

3

POS Returns End-to-End Verification

`postPosReturn()` is coded and called but 0 returns exist in DB yet. Verify the full return flow including COGS reversal and Output VAT reversal. Backfill 12 POS sales missing COGS GL entries.

4

F2 Dead Code — `journal_mappings` + `autoPostEvent()`

All `journal_mappings` rows are `is_active=0`; `autoPostEvent()` in 3 files is a no-op. Remove dead calls to eliminate confusion.
