REPORT INFORMATION

Report Reference:	RPT-BMS-2026-0626
Report Date:	26 June 2026
Scope:	All work completed since the 25 June 2026 daily report
Prepared By:	Wambura Muhere — wambura.muhere@bjptechnologies.co.tz
Organisation:	BJP Technologies Co. Ltd, Tanzania
System:	BMS (Business Management System)

NOTE TO READER

This report is prepared for management and all stakeholders. It describes every new feature, improvement, and correction made to the BMS system in plain, non-technical language — explaining where each change appears, what it looks like, and how it helps the business.

OVERVIEW

Today was entirely dedicated to the audit, accountability, and intelligence layer of the system — answering: who did what, when, from where, and on what device. Three directions: the Activity Log was transformed into a professional audit tool; Customer/Supplier/Sub-Contractor forms were made self-sufficient with smart dropdowns; and a brand-new Login History section was built under Admin, showing who logged in, from which city and region, on what device, and for how long.

1. CUSTOMERS, SUPPLIERS & SUB-CONTRACTORS — SELF-GROWING FORM DROPDOWNS

1.1 The Problem That Was Solved

Several fields in the Add and Edit forms — including Type, Payment Terms, Currency, Category, and Year — offered a fixed list of choices. When a user needed a value that was not in the list, they had no way to add it without asking a developer to update the system configuration.

1.2 What Was Built

These fields now work as self-growing dropdowns. Each one presents the existing choices as before, but also offers an "Other" option at the bottom. Choosing "Other" reveals a text box where the user types the new value. When the form is saved, that new value is permanently added to the list and will appear as a regular choice for every future user from that point on.

This applies to all three modules — both Add and Edit forms — across five fields each:

- Suppliers — Type, Payment Terms, Currency, Category, Year
- Sub-Contractors — Type, Payment Terms, Currency, Category, Year
- Customers — Type, Payment Terms, Currency, Category, Year

No system configuration, no developer involvement, and no database editing is needed. The system learns the new value the moment the record is saved. An additional global fix was applied so that all dropdowns throughout the system work correctly inside pop-up forms and modals — previously, clicking an option inside a modal would sometimes close the dropdown before the selection registered.

2. SUPPLIER & SUB-CONTRACTOR LISTS — DISPLAY FIXES

- Action button — The per-row action button previously showed a gear icon alongside the word "Actions". The text has been removed; the gear icon alone now serves as the button, consistent with the rest of the system.
- Projects Involved panel (on the detail page) — When a supplier or sub-contractor was registered, the project chosen at registration was stored but never appeared in their "Projects Involved" panel. It now appears at the top of the list, clearly marked with a "Primary" badge. All subsequent project assignments appear below it in the usual way.

3. ACTIVITY LOG — FULL PROFESSIONAL UPGRADE

3a. Consistent Log Format Across the Whole System (5 Phases)

Every action recorded in the Activity Log — View, Create, Edit, Delete, Review, Approve — now follows one standard format. The Type column shows a short clean label (e.g. "View Customers", "Create Invoice", "Delete Payment") and the Description column shows the full detail. Previously, different modules used different wording — some said "Created", others "Added", others "UPDATE" — making the log inconsistent and the filter unreliable. The standard has been applied across five phases:

- Phase 1 — Customers, Suppliers, Invoices, Products
- Phase 2 — Finance: Purchase Orders, Sales Orders, Quotations, Expenses, Revenue, Payment Vouchers, Journals, Bank Reconciliation
- Phase 3 — HR: Employees, Leave, Payroll
- Phase 4 — Operations (Projects, Warehouses, Assets) and CRM (Leads, Campaigns, Activities)
- Phase 5 — Settings: Chart of Accounts, Users, User Roles, Tenders — plus a Leave reference bugfix

3b. Every Delete in the System Is Now Logged (7 Batches, 50+ Actions)

Before today, most delete actions either wrote nothing to the Activity Log at all, or wrote only to a separate audit table that is not visible on the Activity Log page. This has been closed across seven batches covering the entire system. Every delete now records: "User deleted [entity name] with ID [number]".

Modules covered:

- HR — Employees, Attendance, Leave, Payroll

- Finance — Invoices, Expenses, Vouchers, Journals, Budgets, Bank Reconciliations, Payments, Credit & Debit Notes
- Procurement & Stock — Purchase Orders, Purchase Returns, Delivery Notes, RFQs, Products, Stock Adjustments, Warehouses
- Sales & CRM — Customers, Sales Orders, Quotations, Sales Returns, LPOs, Leads, Campaigns, Activities
- Operations — Projects, IPCs, Inspections, Scope Documents, Project Documents
- Documents & Settings — Document Templates, Email/SMS Templates, Signatures, Brands, Categories, Compliance, Notifications, Asset Categories, Accounts, Account Categories, Cash Register Shifts
- Parties — Suppliers, Sub-Contractors

3c. Six-Type Activity Filter

The Activity Log now has a Type filter with six clear options: View, Create, Edit, Delete, Review, and Approve. Selecting one shows only entries of that kind. Previously the filter showed hundreds of distinct action phrases making it unusable in practice.

3d. Summary Cards Follow Active Filters

The four summary cards (Total, Views, Creates/Edits, Deletes) previously always showed today's totals regardless of any filters applied. They now update in real time — filter by a specific user or a specific period and the cards show the totals for that selection only.

3e. Period Buttons and Custom Date Range

Quick period buttons — Today, This Week, This Month, Last Month, This Year — update both the table and the summary cards together. A "Custom (Specify)" option accepts any start and end date. The default view shows all records across all time.

3f. Performance — Handles 65,000+ Entries Without Slowing

The Activity Log table is now server-side: the browser asks for only the current page of results, the server fetches exactly those rows, and pagination, sorting, and the search box all happen at the database level. The page loads in the same time whether the log holds 100 entries or 1,000,000. The system currently holds over 65,000 log entries.

3g. Login and Logout Events + Time-in-System Panel

Every login and logout is now recorded as an entry in the Activity Log. When viewing the log filtered by a specific user, a Time in System panel appears showing: total time spent in the system across all sessions, number of sessions, average session length, date and time of most recent login, and a table of recent sessions showing login time, logout time, duration, and how the session ended (manual logout, session timeout, or still active).

4. ADMIN — LOGIN HISTORY (NEW SECTION)

A brand-new page has been added under Admin > User Management > Login History. This page gives administrators a complete, enriched record of every login to the system — something the Activity Log records in a single line but this page expands into full location and device detail.

4.1 Summary Cards at the Top

Card	What It Counts
Total Logins	Every login ever recorded in the system
Today	Logins made on the current date
Unique Users	Number of distinct users who have ever logged in
Active Now	Users whose session is currently open (no logout recorded yet)

4.2 Table Columns — With Example Data

Column	What It Shows	Example Data
#	Row number	1, 2, 3 ...
User	Full name on top line, email address below	W. Nyagawa / w.nyagawa@bjp.co.tz
IP Address	The network address the user connected from	197.186.42.11
Location & Device	City (bold) on top; Region and Country on next line; Browser + OS + Device Type below; Timezone at bottom	Dar es Salaam Dar es Salaam Region, Tanzania Chrome on Windows 11 (Desktop) Dar es Salaam (Africa)
ISP / Org	Internet provider and organisation name	Vodacom Tanzania / Vodacom
Role	User's role, colour-coded by seniority	Admin (red), Accountant (blue), HR (green)

Login Time	Date and time of login; "Active" badge if still open	26/06/2026, 09:14:33 [Active]
Duration	How long the session lasted	2h 07m / 45m 22s / — (open)

4.3 How Location and Device Data Is Captured

Every piece of data shown is real and captured at the moment of login — nothing is hardcoded or estimated.

- Location (City, Region, Country, ISP, Timezone) is looked up from the user's IP address using a free geo-IP service called ip-api.com at the moment of login. The lookup takes at most three seconds. If it fails or times out, the login proceeds normally — it is always best-effort and never blocks access. For logins from inside the office network (private IP addresses), the location shows "Local / Internal Network" rather than making a pointless external lookup.
- Device (Browser, OS, Device Type) is read from the browser's identification string that every browser sends automatically with every request: Browser (Chrome, Firefox, Edge, Safari, Opera, Samsung Browser and others); OS (Windows 11, Windows 10, macOS, Android with version, iOS with version, iPadOS, Linux); Device Type (Desktop, Mobile, or Tablet).
- Timezone is presented in human-readable form — "Dar es Salaam (Africa)" rather than the raw internal code "Africa/Dar_es_Salaam".

Note on Windows 10 vs Windows 11: Microsoft kept the same browser identification string for both versions, so browsers cannot always distinguish them. Chrome and Edge send an additional signal (Sec-CH-UA-Platform-Version) that allows exact detection — those logins will show "Windows 11" or "Windows 10" precisely. Firefox does not send this signal, so Firefox users on Windows show "Windows 10/11". This is honest and not a limitation of the system.

4.4 How Login History Differs From the Activity Log

Activity Log		Login History
Purpose	Full audit trail of everything that happened — views, creates, edits, deletes	Dedicated record of access — who connected, from where, on what device
Login entry	One line: "User logged in" with name and timestamp	Full row: IP, city, region, country, ISP, browser, OS, device type, timezone, duration
Geo / device data	None	Full location and device enrichment at every login
Time-in-System	Per-user panel (visible when filtered by a specific user)	Duration column shown on every single row
Best used for	Investigating what was changed, created, or deleted and when	Investigating access patterns, unusual locations, or unrecognised devices

4.5 Login History Page — As It Appears in the System

The diagram below shows the actual layout of the Login History page with representative sample data.

Figure 4.1 — Login History page (Admin > User Management > Login History)

5. SECURITY — NIP MATERIALS PERMISSION ALIGNMENT

A page inside the NIP (Notice of Intent to Purchase) module was using an incorrect permission key. This meant that the standard role-based access control could not properly govern who could edit NIP materials — the permission appeared in the system but was not connected to the actual page. The key has been corrected so that administrators can now properly assign and restrict access through the User Roles screen, as with every other module in the system.

. WHAT WAS ACHIEVED TODAY

- Every dropdown in Customers, Suppliers, and Sub-Contractors is now self-sufficient. Users can introduce new values on the spot without waiting for system configuration. The "Projects Involved" panel now shows the primary project that was always stored but never displayed.
- The Activity Log is now a professional audit tool. Every delete across the entire system is recorded. Every view, create, and edit follows a single consistent format. The page handles unlimited history without slowing. Filters are powerful and summary cards always reflect what is currently filtered. Login and logout events are visible in context alongside all other activity.
- Login History is a new, intelligent admin section. It answers the questions the Activity Log cannot: where was the user when they logged in, what device were they on, which network provider were they using, and how long did they stay? Every data point is captured live at login and presented in a clean, searchable, paginated table.
- NIP Materials access control is correctly wired — the permission now connects properly to the page and can be managed through User Roles.

. SUMMARY

Today consolidated the system's accountability layer end to end. Gaps that existed for months — delete actions that left no trace, inconsistent log wording, a log page that slowed as history grew, and no way to see where users logged in from — have all been closed in a single session.

The Activity Log is now a complete internal audit trail. The Login History page adds external-access intelligence that most basic systems never offer. And the self-growing dropdowns remove a persistent friction point that required developer involvement for what should be a routine task.

This report covers the work completed on 26 June 2026.
